Winter Triticale Variety Test

Abstract

Thirteen varieties were included in the 2004 winter triticale variety test at Crawfordsville. Each variety was sown in three different plots to average the effects of soil variability. The varieties were planted September 30, 2003, at a rate of 1.5 bushels/acre. The triticale plots were harvested on July 12.

Materials and Methods

Thirteen varieties were included in the 2004 winter triticale variety test at Crawfordsville. Each variety was sown in three different plots to average the effects of soil variability. The varieties were planted September 30, 2003, at a rate of 1.5 bushels/acre. The triticale plots were harvested on July 12.

Results

Average winter triticale grain yield at Crawfordsville in 2004 was 47 bushels/acre, 31 bushels/acre less than the long-term average yield shown in Table 1. Based on the long-term data, NE426GT was the highest-yielding variety. Décor had the highest test weight in 2004.

Additional information on winter triticale variety tests in the state can be found in the publication, "Iowa Crop Performance Tests—Winter Wheat, 1998–2004, and Winter Triticale, 2002–2004," which is available from county extension offices (AG-6) and at www.public.iastate.edu/~jjannink/.

Table 1. Performance of winter triticale varieties tested at Crawfordsville.
