# Oat Variety Test

## **Abstract**

Thirty-three varieties were included in the 2000 oat test at Crawfordsville. Each variety was sown in three different plots to average out the effects of soil variability. The varieties were planted March 15 at a rate of 3 bushels/acre. The oat plots were harvested on July 20.

## Materials and Methods

Thirty-three varieties were included in the 2000 oat test at Crawfordsville. Each variety was sown in three different plots to average out the effects of soil variability. The varieties were planted March 15 at a rate of 3 bushels/acre. The oat plots were harvested on July 20.

## Results

Average oat grain yield at Crawfordsville in 2000 was 93 bushels/acre, 8 bushels/acre more than the average yield in 1999 (Table 1). Based on three years of data (1998 - 2000), Blaze was the highest yielding variety. Jerry had the highest test weight among hulled (normal) oat varieties in 2000. Paul is a hull-less variety and thus had a higher test weight.

Additional information on oat and barley variety tests in the state can be found in the publication, "Iowa Crop Performance Tests - Oat and Barley, 1997-2000," which is available from county extension offices (Pm-1645).
